Handbook of

Rock Analysis

by
Phil J Potts

Viridian Publishing

Contents

1 Concepts in analytical chemistry

1.1 Introduction 1
1.2 Terms and definitions in analytical chemistry 1
1.3 Units of measurement: the international system (SI) of units 4
1.4 Statistics 7
1.5 Detection limits 15
1.6 Sampling strategies: inhomogeneity effects 18
1.7 Contamination effects 20
1.8 Reporting analytical data 27
1.9 Standard additions calibrations 28
1.10 Rock reference materials 28
1.11 Which technique for which element? 42

2 Classical and rapid methods of analysis

2.1 Rock dissolution techniques: acid attack 47
2.2 Rock dissolution procedures: fusion with alkali salts 52
2.3 Classical methods of rock analysis 55
2.4 Evolution of rapid methods of analysis 58
2.5 Photometry 58
2.6 Flame photometry 62
2.7 Titrations involving ethylenediaminetetra-acetic acid (EDTA) 64
2.8 A rapid scheme of analysis 66
2.9 Determination of ferrous iron 67
2.10 The determination of water and carbon dioxide 70
2.11 The auto-analyser 75

3 Optical spectrometry: principles and instrumentation

3.1 Principles 71
3.2 The nature of light 78
3.3 Atomic spectroscopy 80
3.4 The electronic structure of atoms: quantum theory 80
3.5 Spectroscopic notation for electron orbital configurations: the Russell-Saunders coupling scheme 82
3.6 The absorption of light 86
3.7 The emission of light 88
3.8 Instrumentation for optical spectroscopy 90
3.9 Monochromator 91
3.10 Optical filters 97
3.11 Slits 98
3.12 Photon detectors 99
3.13 Classical monochromator designs 100
3.14 Stray light effects 103
3.15 Errors in spectrometric measurements 103

4 Atomic absorption spectrometry

4.1 Introduction 106
4.2 Instrumentation 107
4.3 Properties of flames 114
4.4 Flame chemistry and atomization interferences in the flame: atomization processes in the flame 117
4.5 Instrumental and spectral interferences 120
4.6 Instrument optimization for routine analysis 121
4.7 Schemes of analysis using flame atomic absorption 122
4.8 Interference suppression 123
4.9 Detection limits 127
4.10 Routine performance 128
4.11 Electrothermal atomization 128
4.12 Atomization in the hollow graphite furnace 130
4.13 Background correction 138
4.14 Geological applications of furnace AAS 144
4.15 Cold vapour and hydride generators 146
4.16 Solid sampling and novel atomization devices 150

5 Inductively coupled plasma–atomic emission spectrometry

5.1 Historic development and analytical capabilities 153
5.2 The inductively coupled argon plasma 153
5.3 Nebulizers and spray chambers 156
5.4 Physical structure of the plasma 163
5.5 Temperature distribution in the plasma 165
5.6 Atomization and excitation processes 165
5.7 Interferences in the argon plasma 167
5.8 Measurement and analysis of emission spectra 169
5.9 Some instrument considerations–simultaneous *v.* sequential monochromators 173
5.10 Optimizing operating parameters 175
5.11 Calibrations for ICP–AES 179
5.12 Silicate rock analysis 183
5.13 Direct current plasma–optical emission spectrometry 192

6 Arc and spark source optical emission spectrometry

6.1 Historical perspective 198
6.2 Instrumentation 198
6.3 Sample preparation 200
6.4 Behaviour of elements in an arc discharge 201
6.5 Simultaneous multi-element analysis 205
6.6 Conclusions 212

7 Ion-selective electrodes

7.1 Analytical perspective 213
7.2 Instrumentation 213
7.3 The Nernst equation 216
7.4 Interference effects: non-ideal Nernst behaviour 217
7.5 Schemes for the analysis of geological samples for fluorine 218
7.6 Determination of chlorine by ion-selective electrodes 219
7.7 Other techniques for the determination of chlorine and fluorine 222

8 X-ray fluorescence analysis: principles and practice of wavelength dispersive spectrometry

8.1 Analytical characteristics 226
8.2 Energy and wavelength of x-rays 226
8.3 The origin of x-ray spectra 227
8.4 Competing de-excitation routes 233
8.5 Excitation of x-ray spectra 236
8.6 Interaction of x-rays with matter 239

8.7 Matrix effects in geological samples 242
8.8 Mathematical procedures for the correction of absorption-enhancement effects 249
8.9 Instrumentation for wavelength dispersive XRF analysis 253
8.10 Experimental considerations 271
8.11 Routine operating conditions and statistical considerations 278
8.12 Performance in routine analysis 282
8.13 Concluding remarks 285

9 Energy dispersive X-ray spectrometry
9.1 The development of energy dispersive XRF 286
9.2 The Si(Li) detector 286
9.3 Detector configuration and characteristics 289
9.4 Pulse processing electronics 293
9.5 Interaction of x-rays with the silicon detector 297
9.6 Comparison of ED and WD spectrometers 299
9.7 Silicate rock analysis by ED-XRF using direct tube excitation 300
9.8 Spectrum analysis procedures 307
9.9 Routine analysis using direct tube excitation 308
9.10 Indirect excitation methods 315
9.11 Monochromatic polarized excitation using Bragg diffraction at $2\theta = 90°C$ 321
9.12 Radioisotope excitation 322
9.13 Total reflection of primary beam 323
9.14 Concluding remarks 325

10 Electron probe microanalysis
10.1 The development of microprobe techniques 326
10.2 Microbeam techniques 326
10.3 Instrumentation for the electron probe microanalyser 327
10.4 Electron column design 331
10.5 Vacuum requirements 335
10.6 Interactions between the electron beam and sample: the excited volume 336
10.7 Phenomena within the excited volume 337
10.8 X-ray production 343
10.9 Matrix correction procedures 348
10.10 X-ray spectrometers 353
10.11 Calibration and routine operation 358
10.12 Energy dispersive spectrometers 360
10.13 Sample preparation requirements 364
10.14 Microprobe mineral standards 364
10.15 Routine analytical performance 366
10.16 Analysis of non-silicate minerals: uranium, thorium and rare-earth elements 371
10.17 Bulk rock analysis by electron microprobe 378
10.18 The SEM as a microprobe 380
10.19 Concluding remarks 381

11 Other microbeam and surface analysis techniques
11.1 Introduction 383
11.2 The ion probe 383
11.3 The laser microprobe 391
11.4 Particle-induced x-ray emission (PIXE) 392
11.5 Electron spectroscopy for chemical analysis (ESCA) 395
11.6 Transmission electron microscopy: the chemical analysis of thin foils 396

12 Neutron activation analysis
12.1 Introduction 399
12.2 The growth and decay of radioactivity 399
12.3 Radioactive decay schemes 402
12.4 Instrumentation 405
12.5 Pulse-processing electronics 409
12.6 Interaction of gamma radiation with germanium detectors 411
12.7 Typical spectrum 413
12.8 Detector characteristics 414
12.9 Practical considerations–instrumental neutron activation 416
12.10 Determination of photopeak areas 419
12.11 Other analytical considerations 422
12.12 Interferences and systematic errors 424
12.13 Routine schemes of analysis 429
12.14 Chondrite normalized abundances 430
12.15 Epithermal *v.* thermal irradiations 432
12.16 Short-lived isotopes 435
12.17 Radiochemical separation procedures 435
12.18 Prompt gamma neutron activation analysis 438
12.19 Concluding remarks 439

13 Nuclear techniques for the determination of uranium and thorium and their decay products
13.1 Techniques for uranium/thorium determination 440
13.2 The uranium–thorium decay chain 441
13.3 Delayed neutron fission activation analysis 441
13.4 Fission track analysis 445
13.5 Other autoradiography techniques for locating and analysing specific elements in thin section 448
13.6 Gamma spectrometry 452
13.7 Alpha spectrometry 459
13.8 Secular equilibrium with particular reference to uranium/thorium disequilibrium measurements 461
13.9 Uranium and thorium series disequilibrium 462

14 Ion exchange preconcentration procedures
14.1 Introduction 472
14.2 Ion exchange techniques 472
14.3 Characteristics of ion exchange resins 474
14.4 Some theoretical aspects of ion exchange 477
14.5 Optimizing column separations 480
14.6 Applications of ion exchange chromatography to rare-earth element separations 480
14.7 Chelating ion exchange resins 484
14.8 Other preconcentration procedures 485

15 Gold and platinum group element analysis
15.1 Introduction 486
15.2 Fire assay procedures 487
15.3 Acid extraction of noble metals 492
15.4 Other methods of noble metal analysis 492
15.5 Noble metal analysis–comparisons of data 493
15.6 A note on the distribution of noble metals 494
15.7 Graphical presentation of PGE data 496

16 Mass spectrometry: principles and instrumentation
16.1 Introduction 497
16.2 Mass spectrometric techniques in geology 497
16.3 The ion source 498
16.4 The mass analyser 498
16.5 Resolution 500
16.6 Double-focusing mass spectrometer 502
16.7 Quadrupole mass spectrometer 503
16.8 Ion detectors 505
16.9 Vacuum requirements 508
16.10 Abundance sensitivity 508
16.11 Beam switching *v.* multiple collection 509
16.12 Isotopes and mass spectra: the structure of atoms and nuclear stability 510
16.13 Mass defect phenomena 512
16.14 Radioactive isotopes in nature 512
16.15 Geochronology 514
16.16 Geochronometers of geological importance 516

17 Thermal ionization mass spectrometry
17.1 Introduction 523
17.2 Ion production 523
17.3 Rubidium–strontium isotope analysis 525
17.4 Neodymium–samarium isotope analysis 528
17.5 Lead, uranium and thorium isotope analysis 531
17.6 Isotope dilution 536

18 Gas source mass spectrometry
18.1 Geological applications 546
18.2 Instrumentation 546
18.3 The delta convention for reporting isotope data 552
18.4 Hydrogen isotope analysis 552
18.5 Carbon isotope analysis 554
18.6 Nitrogen isotope analysis 555
18.7 Oxygen isotope analysis 556
18.8 Sulphur isotope analysis 558
18.9 Noble gas analysis 559
18.10 Potassium–argon geochronometry 560

19 Spark source mass spectrometry
19.1 Introduction 566
19.2 Instrumentation and ion production 566
19.3 Internal standardization 568
19.4 Routine data acquisition 568
19.5 Photoplate calibration and element sensitivities 569
19.6 Applications and results 571
19.7 Future developments 573

20 Inductively coupled plasma–mass spectrometry
20.1 Introduction 575
20.2 Development of ICP–MS instrumentation: the plasma–mass spectrometer interface 575
20.3 The inductively coupled plasma as ion source 578
20.4 ICP–mass spectrometry instrumentation 582
20.5 Performance and applications 583
20.6 Internal standardization 583
20.7 Isotope dilution 584
